

Active Learning for Efficient Bayesian Inverse Problems: Online Gaussian Process Surrogates in Delayed Acceptance MCMC

Filippo Zacchei, Manuel Alfano, Attilio Frangi, Andrea Manzoni

June 19, 2025

Abstract

This is a simple abstract. Summarize your paper here.

1 Introduction

Write your introduction here.

2 Methodology

Describe your method here.

Let's check what happens if we add some more text to the methodology section. This will help us understand how the document structure is maintained and how the content flows from one section to another. We can also include some equations or figures if necessary to illustrate our points more clearly. We can also discuss the algorithms used, the data sets employed, and any specific techniques that were applied during the research. This section is crucial as it provides the foundation for the results that will be presented later. It is important to be detailed yet concise, ensuring that the reader can follow the methodology without getting lost in unnecessary jargon or overly complex explanations. This will ensure that the methodology is clear and reproducible, which is a key aspect of scientific writing. We can also include references to previous works that have influenced our approach or provided a basis for our methods. This will not only give credit to prior research but also situate our work within the broader context of the field. We can also consider adding some figures or tables to illustrate our methodology more.

3 Numerical results

Present your experiments here.

4 Conclusion

Summarize your findings here.
